About

http://data.globalchange.gov

The Third National Climate Assessment

On May 6, 2014, the US Global Change Research Program released the Third National Climate Assessment (NCA3).

- PDF(s) (`http://data.globalchange.gov/report/nca3`)
- Website (`http://nca2014.globalchange.gov`)

The Third National Climate Assessment

- 829 pages
- Over 300 authors, numerous editors, analysts, graphics producers, scientists, data scientists, software developers, and web teams
- 161 findings, 284 figures, 3,395 bibliographic references (journal articles, books, reports

Identifiers

Metadata
Figure: Global Temperature and Carbon Dioxide
Caption: Global annual average temperature (as measured over both land and oceans) has increased by more than 1.5°F (0.8°C) since 1880 (through 2012). Red bars show temperatures above the long-term average, and blue bars indicate temperatures below the long-term average. The black line shows atmospheric carbon dioxide (CO_2) concentration in parts per million (ppm). While there is a clear long-term global warming trend, some years do not show a temperature increase relative to the previous year, and some years show greater changes than others. These year-to-year fluctuations in temperature are due to natural processes, such as the effects of El Niños, La Niñas, and volcanic eruptions. (Figure source: updated from Karl et al. 2009[1]).

Relational

- Canonical representation
- One-many, many-one, many-many relationships
- Referential integrity
- Strict type checking
- Column constraints
- Cascading updates and deletes
- Well-known optimization techniques
- Wide-spread adoption
- Extendable (hstores in PostgreSQL)
- Closed world assumption

Semantic

- Relationships are first class objects
- Concepts are formally defined in an ontology
- Formal definitions help remove ambiguities
- Interoperability with other systems
- Open world assumption

Relational Model Changes

Changes to the schema propagate to the JSON API. JSON key names match the column names, and nested JSON objects correspond to relationships.

1. Write a test for new REST functionality.
2. Run the tests. Do the tests pass?
3. Yes? Done.
4. No? Write a schema patch.
5. Goto step 2.

The tests remain part of the test suite, which is run continuously.

Semantic Model Changes

Change to the triple are handled by turtle templates.

1. Write a test with a SPARQL query that should succeed.
2. Run the tests. Do they pass?
3. Yes? Done.
4. No? Modify the turtle templates.
5. Go to step 2.

The tests remain part of the test suite, which is run continuously.

Semantic Model Changes

Sample turtle template :

```
@prefix gcis: <http://data.globalchange.gov/gcis.owl#> .
@prefix dcterms: <http://purl.org/dc/terms/> .

<%= article->uri %> a gcis:Article;
<%= article->uri %> dcterms:isPartOf
    <%= article->journal->uri %>;
```

3. System Architecture
   - Diagram
   - Relational Model Changes
   - Semantic Model Changes
4. Conclusion, Ongoing Work, Future Plans

Current work involves extending the data model for models and model runs, *in situ* station data, spatial metadata (PostGIS), agency-wide publication systems, authors of journal articles, and connecting to disparate sources of information using lexicons, APIs and semantic queries.
